

# 1 Overview

The Content Type Modeller handles and administrates the Content Types for the escidoc framework. In the long term, (not for the first release) in escidoc the dynamic creation of Content Types is envisioned. For the first release only selected pre-fabricated Content Types are used.

The CTM handles only Types for Content Items, which are stored in the OM. The CTM will be primiraly used by the OM to validate Content Items which are provided by the application.

In the first release, the **Content Type Modeller** will provide the functionality to

- Retrieve a list of all existing Content Item types
- Retrieve properties for one Content Item type

Further Funtionalities for upcoming releases:

Later on, there will be functions like the **creation and update of Content Types**.
